The human sciences aim to describe and explain human behaviour of individuals or members of a group.

Although the human sciences comprise a wide range of disciplines such as psychology, social and cultural anthropology, economics, political science and geography, they all have common features such as a shared methodology and the overall object of study: human existence and behaviour.

some sub-populations and not others come to be vulnerable, why a disease spreads in one part of a population and not another, or which gene variants are transmitted across generations, then a remarkable range of disciplinary perspectives need to be brought together, from the study of institutional structures, cultural boundaries, and social networks down to the micro-biology of cellular pathways, and gene expression. The need to explain and address differential impacts of pressing contemporary issues like AIDS, ageing, social and economic inequalities, and environmental change, are well-known cases in point. Population concepts, models, and evidence lie at the core of approaches to all of these problems, if only

because accurate differentiation and identification of groups, their structures, constituents, and relations between sub-populations, are necessary to specify their nature and extent. The study of population thus draws both on statistical methodologies of demography and population genetics and sustained observation of the ways in which populations and sub-populations are formed, maintained, or broken up in nature, in the laboratory, and in society. In an era in which research needs to operate on multiple levels, population thinking thus provides a common ground for communication and critical thought across disciplines. Population in the Human Sciences addresses the need for review and assessment of the framework of interdisciplinary

population studies. Limitations to prevailing postwar paradigms like the Evolutionary Synthesis and Demographic Transition were becoming evident by the 1970s. Subsequent decades have witnessed an immense expansion of population modelling and related empirical inquiry, with new genetic developments that have reshaped evolutionary, population, and developmental biology. The rise of anthropological and historical demography, and social network analysis, are playing major roles in rethinking modern and earlier population history. More recently, the emergence of sub-disciplines like biodemography and evolutionary anthropology, and growing links between evolutionary and developmental biology, indicate a growing

convergence of biological and social approaches to population.

This study, published in 2000, examines the dialogue between Romantic poetry and the human sciences of the period. Maureen McLane reveals how Romantic writers participated in a new-found consciousness of human beings as a species, by analysing their work in relation to discourses on moral philosophy, political economy and anthropology. Writers such as Wordsworth, Coleridge, Mary Shelley and Percy Shelley explored the possibilities and limits of human being, language and hope. They engaged with the work of theorists of the human sciences - Malthus, Godwin

and Burke among them. The book offers original readings of canonical works, including *Lyrical Ballads*, *Frankenstein* and *Prometheus Unbound*, to show how the Romantics internalised and transformed ideas about the imagination, perfectibility, immortality and population which so energised contemporary moral and political debates. McLane provides a defence of poetry in both Romantic and contemporary theoretical terms, reformulating the predicament of Romanticism in general and poetry in particular.

This comprehensive handbook provides an overview and update of the issues, theories, processes, and applications of the social science of population studies. The volume's 30 chapters cover the full range of conceptual, empirical, disciplinary, and applied approaches to the study of demographic phenomena. This book is the first effort to assess the entire field since Hauser and Duncan's 1959 classic, *The Study of Population*. The chapter authors are among the leading contributors to demographic scholarship over the past four decades. They represent a variety of disciplines and theoretical perspectives as well as interests in both basic and applied research.

In this volume the dynamic patterns of human density and distribution are examined in relation to the viability of native species and the integrity of their habitats. Social, biological, and earth scientists describe their models, outline their conclusions from field studies, and review the contributions of other scientists whose work is essential to this field. The book starts with general theories and broad empirical relationships that help explain dramatic changes in the patterns of the occurrence of species, changes that have developed in parallel with human population growth, migration and settlement. In the following chapters specific biomes and ecosystems are highlighted as the context for

## Download Ebook Population In The Human Sciences Concepts Models Evidence

human interactions with other species. A discussion of the key themes and findings covered rounds out the volume. All in all, the work presents our species, *Homo sapiens*, as what we truly have been and will likely remain—an influential, and often the most influential, constituent in nearly every major ecosystem on Earth.

This volume explores the scientific frontiers and leading edges of research across the fields of anthropology, economics, political science, psychology, sociology, history, business, education, geography, law, and psychiatry, as well as the newer, more specialized areas of artificial intelligence, child development, cognitive science, communications, demography,
